

Excel Essentials — Day 2

Sorting & Filtering · Tables · Conditional Formatting · Charts

Part 1 — Sorting & Filtering

Reordering and narrowing down your data

Sorting Data

- Sort rearranges rows by the values in one column
- Data tab → Sort A→Z (ascending) or Z→A (descending)
- Text sorts alphabetically, numbers by value, dates by time
- Click one cell in the column — Excel expands to the whole range
- Multi-level sort: Data → Sort → Add Level for tie-breakers

Filtering Data

- Filter hides rows that do not match a condition — nothing is deleted
- Data tab → Filter adds a dropdown arrow to every header cell
- Tick or untick values, or use Text / Number / Date Filters
- A funnel icon on the header shows that column is filtered
- Filters combine across columns (AND logic)
- Turn Filter off again to restore all rows

Part 2 — Excel Tables

Turning a plain range into a managed table

Creating a Table

- A Table is a named range with built-in structure and behaviour
- Select the range → Insert → Table, or press Ctrl + T
- Tick "My table has headers" so row 1 becomes the header row
- Headers gain filter dropdowns automatically
- New rows typed below the table are absorbed into it
- Formulas can reference columns by name (structured references)

Ready Accessibility: Investigate

200%

Table Design Tab

- Clicking inside a table reveals the Table Design tab
- Table Name box — rename the table for easier referencing
- Style options: Header Row, Total Row, Banded Rows, Filter Button
- First Column / Last Column emphasise the outer columns
- Tools group: Summarize with PivotTable, Remove Duplicates
- Changes here apply to the whole table at once

Resizing a Table

- A table can grow or shrink after it has been created
- Drag the small handle at the bottom-right corner of the table
- Or use Table Design → Resize Table and type a new range
- The new range must include the original header row
- Formatting and filters extend to the added rows and columns automatically

Removing Duplicates

- Deletes rows that repeat the same values — keeps the first occurrence
- Table Design → Remove Duplicates (also on the Data tab)
- Choose which columns Excel should compare
- All columns ticked = only fully identical rows are removed
- Excel reports how many duplicates were removed and how many remain
- The action changes the data — copy the sheet first if unsure

Converting a Table to a Range

- Turns the table back into a normal range of cells
- Table Design → Convert to Range, then confirm with Yes
- Table features are lost: filter buttons, table name, structured references
- The cell formatting (colours, banding) stays behind
- Use it when you only wanted the styling, not the table behaviour

Table Styles

- Table Design → Table Styles gallery: Light, Medium and Dark sets
- Styles follow the workbook theme colours
- Hover to preview a style live before applying
- Banded Rows / Banded Columns improve readability of wide tables
- New Table Style... creates a reusable custom style
- Clear removes the style but keeps the table
